OBJECTIVES

Expected Position Electronics Engineer

Expected Location Belgium

SKILLS

Java	<div style="width: 90%; border: 1px solid orange; margin-bottom: 2px;"></div>	Advanced
c	<div style="width: 60%; border: 1px solid orange; margin-bottom: 2px;"></div>	Intermediate
c++	<div style="width: 60%; border: 1px solid orange; margin-bottom: 2px;"></div>	Intermediate
android development	<div style="width: 90%; border: 1px solid orange; margin-bottom: 2px;"></div>	Advanced
matlab	<div style="width: 20%; border: 1px solid orange; margin-bottom: 2px;"></div>	Novice
veirlog	<div style="width: 90%; border: 1px solid orange; margin-bottom: 2px;"></div>	Advanced
PCB design	<div style="width: 90%; border: 1px solid orange; margin-bottom: 2px;"></div>	Advanced

PERSONAL DETAILS

- Location Belgium
- Political Status Communist Youth League Member
- Height 186cm

EDUCATIONAL BACKGROUND

- Katholieke Universiteit Leuven · Master 2018-09 to 2019-07
Faculty of Engineering Technology Master of Electronics and ICT Engineering Technology
- Katholieke Universiteit Leuven · Bachelor 2016-09 to 2018-09
Electronics Engineering
- TIANJIN University · Bachelor 985 2014-08 to 2018-08

PROJECTS

- Engineering Experience 5--Design of an embedded system 2018-02 to 2018-06
The project is about improving Skweezees. Skweezees are soft objects filled with conductive wool and an assortment of electrodes. The conductivity between the electrodes changes when the soft object is deformed. This conductivity is measured for every possible pair of electrodes. Machine learning is used to differentiate between different gestures (squeeze left, squeeze right, crumple, ...).
I and my colleagues improved the original design with therapeutic use in mind. Skweezee can be used by therapists for psychomotor therapy with children. We added the ability to see the amplitude of different gestures, for example asked the child for a hug and measure the amplitude. We also added an accelerometer to allow for extra gestures like throwing or catching the skweezee. What's more, we designed a new software using java programming to make it easier for children to understand how to play with skweezees.
The knowledge of JAVA programming, PCB design and machine learning were needed.
- Software development 2017-10 to 2017-12
I and my colleague developed an android application called orienteering. In this application, users can create their own account and create their own treasure map in their cities for others to play. Users can also play the treasure maps designed by others. They need to find spots set by the designers and QR codes around the spots. When they scan the QR code, they will get some points. Time and points will be recorded and users can see their rank of different maps.
The knowledge of JAVA programming, android development and database were needed in the project.
